

SECURE ACCESS TO YOUR APPLICATIONS FROM ANYWHERE IN THE WORLD

Any computer connected to the Internet is exposed to virtual attacks. This threat is even more present in the business world. Remote working increases the systems' vulnerability. Each connection to the Internet is an open door onto your internal and confidential data. With more than 2 thousand million Internet users*, having a firewall is no longer an option, it's a necessity.

Your remote protection!

VPN/SSL VPN access allow you to access your corporate network safely when travelling, from any location or from home.

What is a VPN/SSL VPN?

It's a Virtual Private Network which is an extension of you own network that ensures the same level of security and confidentiality you can get in your office.

VPN / SSL VPN are used thanks to a software. They require no material installation. If you are using a public computer, it is possible to access your secured network through an SSL Web portal (without software). The authentication process is directly connected to your main server. You thus use the same passwords as the ones you use at your office. In a single click, your connection is entirely private and secured regardless of the computer you are using. To strengthen your mobility, you can add a VPN / SSL VPN to your Iphone **.

CerberGate, Managed Firewall Services

Our **Managed Firewall Services** are an innovative solution that doesn't require any specific knowledge or any extra cost. Supported and advised by a DFI engineer when setting-up your firewall, you will be able to decide what to block or authorize, for incoming as well as outgoing information flows. We will then provide for maintenance. Our support service is available by phone or email. You can now manage your firewall without any of the constraints!

A personalized solution for a better protection

Adapting itself to your needs thanks to its different options and its custom-designed configuration, Cerbergate allows you to be responsive. For any emergency, you can shortly intervene: We configure a supporting device similar to your original firewall as we regularly backup all of your parameters.
